NAME: TRISHA LAKHANI

USN: 1BM19CS214

COURSE NAME: DATABASE MANAGEMENT SYSTEMS

COURSE TITLE: 19CS4PCDBM

SEM: 4 SECTION:D

PROGRAM 1: Insurance Database

Consider the Insurance database given below. The data types are specified.

PERSON (driver_id: String, name: String, address: String)

CAR (reg_num: String, model: String, year: int)

ACCIDENT (report_num: int, accident_date: date, location: String)

OWNS (driver_id: String, reg_num: String)

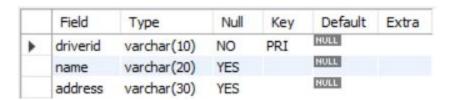

PARTICIPATED (driver_id: String,reg_num: String, report_num: int, damage_amount: int)

i) Create the above tables by properly specifying the primary keys and the foreign keys.

create database Insurance2;

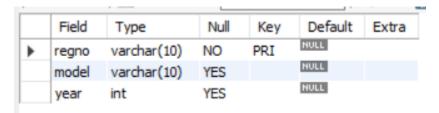

use Insurance2;

create table person(driverid varchar(10),name varchar(20), address varchar(30),primary key(driverid)); desc person;

create table car(regno varchar(10)primary key,model varchar(10),year int);

desc car;

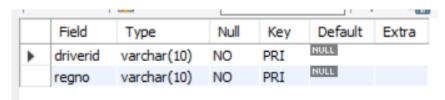

create table accident(reportno int,adate date,location varchar(20),primary key(reportno));

desc accident;

iii)Demonstrate how you

a.Update the damage amount to 25000 for the car with a specific reg-num(example 'K A053408') for which the accident report number was 12.

b.Add a new accident to the database.

update participated set damageamt=25000 where regno='KA053408' and reportno=12; commit;

	15	2005-03-04	Kanakpura Road
	16	2008-03-15	Domlur
	NULL	NULL	NULL

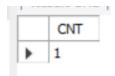

iv)Find the total number of people who owned cars that involved in accidents in 2008.

select count(distinct driverid) CNT from participated a, accident b where a.reportno=b.reportno and year(b.adate)=2008;

v)Find the number of accidents in which cars belonging to a specific model (example)were involved.

select count(reportno) CNT from car c,participated p where c.regno=p.regno and model='Lancer';

PROGRAM 2: BANKING ENTERPRISE DATABASE

Consider the following database for a banking enterprise.

Branch (branch-name: String, branch-city: String, assets: real)

BankAccount(accno: int, branch-name: String, balance: real)

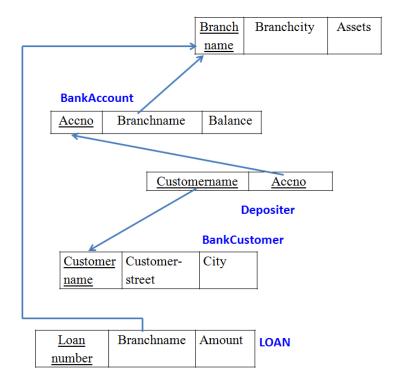

BankCustomer (customer-name: String, customer-street: String, customer-city: String)

Depositer(customer-name: String, accno: int)

Loan (loan-number: int, branch-name: String, amount: real)

INTRODUCTION: This database is developed for supporting banking facilities. Details of the branch along with the accounts and loans handled by them are recorded. Also details of the depositors of the corresponding branches are maintained.

Schema Diagram

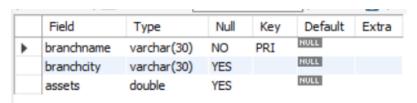

i. Create the above tables by properly specifying the primary keys and the foreign keys.

create database bank;

use bank;

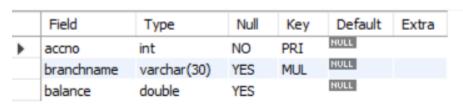

create table Branch(branchname varchar(30),branchcity varchar(30),assets real,primary key(branchname));

desc Branch;

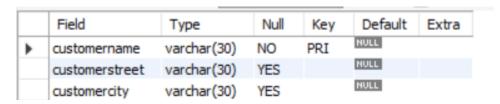

create table BankAccount(accno int,branchname varchar(30),balance real,primary key(accno),foreign key(branchname) references Branch(branchname));

iii. Find all the customers who have at least two accounts at the *Main* branch (ex. SBI_ResidencyRoad).

SELECT c.customername FROM BankCustomer c WHERE EXISTS(SELECT

d.customername, COUNT (d.customername) FROM Depositer d, BankAccount ba WHERE

d.accno=ba.accno AND c.customername=d.customername AND ba.branchname='SBI_ResidencyRoad' GROUP BY d.customername HAVING COUNT(d.customername)>=2);

iv. Find all the customers who have an account at *all* the branches located in a specific city (Ex. Delhi).

select distinct d.customername from Depositer d where exists(select * from BankAccount ba where ba.accno=d.accno and exists (select * from Branch b where b.branchname = ba.branchname and b.branchcity='Delhi'));

v. Demonstrate how you delete all account tuples at every branch located in a specific city (Ex. Bombay).

PARTS(pid: integer, pname: string, color: string)

CATALOG(sid: integer, pid: integer, cost: real)

The Catalog relation lists the prices charged for parts by Suppliers.

Write the following queries in SQL:

WHERE P.pid = C.pid;

ii) Find the snames of suppliers who supply every part.

select s.sname from suppliers s where s.sid in (select c.sid from catalog c group by c.sid having count(distinct (c.pid))=(select count(p.pid) from parts p));

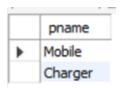

iii) Find the snames of suppliers who supply every red part.

select ca.pid from catalog ca where ca.sid= (select s.sid from suppliers s where s.sname ='Acme Widget') having (select count(c.pid) from catalog c where c.pid=ca.pid)=1;

v) Find the sids of suppliers who charge more for some part than the average cost of that part (averaged over all the suppliers who supply that part).

vi) For each part, find the sname of the supplier who charges the most for that part.

```
SELECT P.pid, S.sname

PROGRAM 4: STUDENT FACULTY DATABASE

Consider the following database for student enrollment for course:

STUDENT(snum: integer, sname: string, major: string, lvl: string, age: integer)

CLASS(<u>cname</u>: string, meets at: time, room: string, fid: integer)

ENROLLED(<u>snum</u>: integer, <u>cname</u>: string)

FACULTY(<u>fid</u>: integer, fname: string, deptid: integer)

The meaning of these relations is straightforward; for example, Enrolled has one record per studentclass pair such that the student is enrolled in the class. Level(lvl) is a two character code with 4 different values (example: Junior: JR etc)

Write the following queries in SQL. No duplicates should be printed in any of the answers.

```
create database student_faculty;
use student_faculty;

PROGRAM 5: AIRLINE FLIGHT DATABASE

Consider the following database that keeps track of airline flight information:

FLIGHTS(<u>flno</u>: integer, from: string, to: string, distance: integer, departs: time, arrives: time, price: integer)

AIRCRAFT(aid: integer, aname: string, cruisingrange: integer)

CERTIFIED(eid: integer, aid: integer)

EMPLOYEES(<u>eid</u>: integer, ename: string, salary: integer)

Note that the Employees relation describes pilots and other kinds of employees as well; Every pilot is certified for some aircraft, and only pilots are certified to fly.

Write each of the following queries in SQL.
